

Homemade Propagator ZOOM Session with Robin

Equipment you might need

Clear plastic drinks bottles
Plastic food packaging trays
Scissors
Polythene
Plastic bubble wrap
General purpose potting compost
Superfood seeds (broccoli, sunflower and watercress)

Time to make your propagator

Use what you have learnt from the presentation to design your propagator. Think about the materials you will use to make it. Don't forget to think about what seeds you will grow inside the propagator too!

Time to grow!

Next, plant some seeds and wait for them to germinate and grow into seedlings. You might like to grow some seeds in another pot so you can compare which seeds grow faster.

Evaluate your design

Think about how quickly your seeds germinated and how healthy they look compared with those outside the propagator.

Final top tips?

Remember to water your plants! Even if they're outdoors they won't get any rain because of the lid. If you've not got any seeds why not try and save some from fruits or vegetables, you're eating this week
